                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             12 LVLLAVALQATEAGFYGANMEDSVCCRDYVRYRLPLRVVKHFYWTSDSCPRPGVVLLTFR 71
              J. BIOL. Chem. 273:1764-1768(1998).

-I. FUNCTION: MAY PLAY A ROLE IN THE TRAFFICKING OF ACTIVATED/EFFECTOR T LYMPHOCYTES TO INFLAMMATORY SITES AND OTHER ASPECTS OF ACTIVATED T LYMPHOCYTE PHYSIOLOGY. CHEMOTACTIC FOR MONOCYTES, DENDRITIC CELLS AND NATURAL KILLER CELLS. MILD CHEMOATTRACTANT FOR PRIMARY ACTIVATED I LYMPHOCYTES AND A POTENT CHEMOATTRACTANT FOR CHRONICALLY ACTIVATED T LYMPHOCYTES BUT HAS NO CHEMOATTRACTANT ACTIVITY FOR NEUTROPHILS, EOSINOPHILS, AND RESTING I LYMPHOCYTES. BINDS TO CCR4.
                                                                                                                                                                                                                                                                                                                                             SUBCELLULAR LOCATION: Secreted.
TISSUE SPECIFICITY: HIGHLY EXPRESSED IN MACROPHAGE AND IN MONCYTE-DERIVED DENDRITIC CELLS, AND THYMUS. ALSO FOUND IN LYMPH NODE, APPENDIX, ACTIVATED MONCYTES, RESTING AND ACTIVATED MACROPHAGES. LOWER EXPRESSION IN LUNG AND SPLEEN. VERY WEAK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 EXPRESSION IN SMALL INTESTINE. SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOKINE

                     - 1- SUBCELLULAR LOCATION: Secreted.
- 1- SUBCELLULAR LOCATION: Secreted.
- 1- TISSUE SPECIFICITY: EXPRESSED AT HIGH LEVELS IN LUNG, LYMPH NODES, PLACENTA, BONE MARROW, DENDRITIC CELLS PRESENT IN GERMINAL CENTERS AND T-CELL AREAS OF SECONDARY LYMPHOID ORGANS AND MACROPHAGES
- DERIVEDE FROM PERIPHERAL BLOOD MONOCYTES, NOT EXPRESSED BY PERIPHERAL BLOOD MONOCYTES, NOT EXPRESSED BY PERIPHERAL BLOOD MONOCYTES AND A MONOCYTE-TO-MACROPHAGE
- DIFFERENTIATION IS A PREBEQUISITE FOR EXPRESSION.
- INDUCTION: SPECIFICALLY INDUCED IN MACROPHAGES BY IL-4, IL-13, AND IL-10. EXPRESSION IS INHIBITED BY IFN-CAMMA WHILE GLUCOCORTICOIDS EXERT A SLIGHTLY POSITIVE SYNERGISTIC EFFECT IN COMBINATION WITH IL-4. STRONGLY INDUCED IN SEVERAL HUMAN CELL LINES, INCLUDING MONOCYTIC U937 CELLS, BY PHORBOL MYRISTATE ACETATE (PMA).
- SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOKINE C.C.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 LVLLAVALQATEAGPYGANMEDSVCCRDYVRYRLPLRVVKHFYWTSDSCPRPGVVLLTFR 60

"Cytokine-induced neutrophil chemoattractant (CINC)-2 alpha, a novel member of rat GRO/CINCs, is a predominant chemokine produced by lipopolysaccharide-stimulated rat macrophages in culture.";

Biochem. Biophys. Res. Commun. 220:945-948(1996).

-! FONCTION: MONOKINE WITH INFLAMMATORY AND CHEMOKINETIC PROPERTIES.

HAS CHEMOTACTIC ACTIVITY FOR MONOCYTES, NEUTROPHILS, EOSINOPHILS, BASOPHILS, AND LYMPHOCYTES. REQUIRED FOR LUNG INFALPHA PRODUCTION, NEUTROPHIL RECRUITMENT AND SUBSEQUENT LUNG INJURY AND
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SUBCELLULAR LOCATION: Secreted.
INDUCTION: BY LIPOPOLYSACCHARIDE (LPS).
SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOKINE C-C) (CHEMOKINE CC).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytokine; Chemotaxis; Inflammatory response; Signal; Heparin-binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

-: ALTERNATIVE PRODUCTS: 2 ISOFORMS; HCC-1 (SHOWN HERE) AND HCC-3;
ARE PRODUCED BY ALTERNATIVE SPLICING.
-: TISSUE SPECIFICITY: EXPRESSED CONSTITUTIVELY IN SEVERAL NORMAL
TISSUES: SPLEEN, LIVER, SKEEFTAL AND HEART MUSCLE, GUT, AND BONE
MARROW. PRESENT AT HIGH CONCENTRATIONS (1-80 MM) IN PLASMA.
-: SIMILARITY: BELONGS TO THE INTERCRINE BETA FAMILY (SMALL CYTOKINE
INTRACELLULAR CA2+ CHANGES AND ENZYME RELEASE, BUT NO CHEMOTAXIS, AT CONCENTRATIONS OF 100-1,000 NM. AND WAS INACTIVE ON T LYMPHOCYTES, NEUTROPHIE, AND EOSINOPHIL LEUKOCYTES. ENHANCES THE PROLIFERATION OF CD34 MYELOID PROGENITOR. CELLS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    30-MAY-2000 (Rel. 39, Created)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    atherosclerosis. Probes and/or primers for the identification of MDC encoding sequences can be derived from MDC encoding sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (Cys-cys) subfamily of cytokines has been isolated. MDC and it's analogues may be used in the treatment of inflammatory diseases especially diseases characterised by monocyte chemotaxis towards a site of inflammation. MDC and it's analogues also induce fibroblast proliferation having a positive effect in wound healing and anglogenesis. They may prove to be clinically important in the treatment of tumours, by directly or indirectly inhibiting tumour formation. Antibodies directed against MDC and its analogues may be used in the treatment of Crohn's disease, rheumatoid arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /label Arg, Gly, Ala, Val, Leu, Ile, Pro, Ser, Thr,

                                                                                                                                                                                               Gln, Cys
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a macrophage derived chemokine (MDC) analogue. MDC analogues are capable of inhibiting MDC induced chemotaxis. Therefore, the MDC analogues may be used to modulate inflammatory and immune responses allowing for the treatment of disorders associated with excessive inflammation or overactive immune responses. Inflammatory disorders which may be treated in this way include Crohn's disease (manifested by chronic inflammation of the bowel), atherosclerosis, arthritis and pulmonary fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present sequence represents synthetic analogues of the novel human macrophage derived C-C chemokine MDC that contain amino acid alterations compared with native MDC (see AAY05871). Such MDC polypeptide analogues are specifically contemplated to modulate the binding characteristics of MDC to chemokine receptors and/or cother molecules that are considered to be important in presenting MDC to its receptor. The MDC antagonists are used in claimed mot to its receptor. The MDC antagonists are used in claimed competed for the preparation of medicaments for the suppression of the proliferation of a mammalian immunodeficiency virus, for inhibiting platelet aggregation in a mammal, for the treatment or palliation of lupus erythematosus in a mammal, for inhibiting C MDC-induced activation, chemotaxis or proliferation of cells that express CCR4, for inhibiting or palliating an allergic reaction in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 especially diseases characterised by monocyte chemotaxis towards a site of inflammation. MDC and it's analogues also induce fibroblast proliferation having a positive effect in wound healing and treatment of tumours, by directly or indirectly inhibiting tumour formation. Antibodies directed against MDC and its analogues may be used in the treatment of Crohn's disease, rheumatoid arthritis and atherosclerosis. Probes analogue for the identification of MDC encoding sequences can be derived from MDC encoding sequences.
                                                                                                                                                                                                            MDC; macrophage derived chemokine; C-C; Cys-Cys; Crohn's disease; rheumatoid arthritis; chemotaxis; fibroblast proliferation; wound healing; anglogenesis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Macrophage derived chemokine (MDC) and analogues - used in the treatment of inflammatory diseases, MDC antibodies used to treat Crohn's disease, rheumatoid arthritis, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A new macrophage derived chemokine, MDC, a member of the C-C (Cys-Cys) subfamily of cytokines has been isolated. MDC and it's analogues may be used in the treatment of inflammatory diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;;

This sequence represents a novel human chemokine protein, 331D5. Nucleic acid sequences encoding the chemokines can be used for detection, in e.g. forensic techniques. Antibodies and other binding agents may be used in diagnostics. The chemokines themselves are useful for treatment of, e.g. cancer or degenerative conditions. Abnormal proliferation, regeneration, degeneration or atrophy may be treated by the inventive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Chemokine; human; detection; forensic; diagnostic; treatment; cancer; degenerative condition; abnormal proliferation; regeneration;
